The Montana Water Supply Outlook is a publication of the U. S. Soil Conservation Service. The SCS administers the Cooperative Snow Survey Program in cooperation with other federal, state and private agencies, organizations, and individuals.

The report is prepared by SCS, Snow Survey and Water Supply Forecast Staff, Room 443, Federal Building, 10 East Babcock, Bozeman, Montana.

Administration proposes ending snow surveys

The President's 1986 budget request to Congress calls for termination of the Snow Survey and Water Supply Forecast activity within the U.S. Soil Conservation Service for fiscal policy reasons. If the President's budget request is enacted by Congress the snow survey program will be eliminated by the end of fiscal year 1986. This action would conclude over 50 years of federally coordinated and supported snow survey effort in the Western United States.

Snowpack generally below average

The snowpack in the mountain headwaters in the northern half of the state is generally near average. The southern half has below to well below average snow cover.

The only area showing above average snowpack is the Bear Paw Mountains near Havre.

Well below average snow water content exists in the Rock, Flint, and Boulder Creek areas near Philipsburg, the Bridger Range near Bozeman and the lower Rock and lower Clark's Fork River areas near Red Lodge.

Snowpack is below average over most of the other drainages in the southern half of Montana.

Montana streamflows may be below average

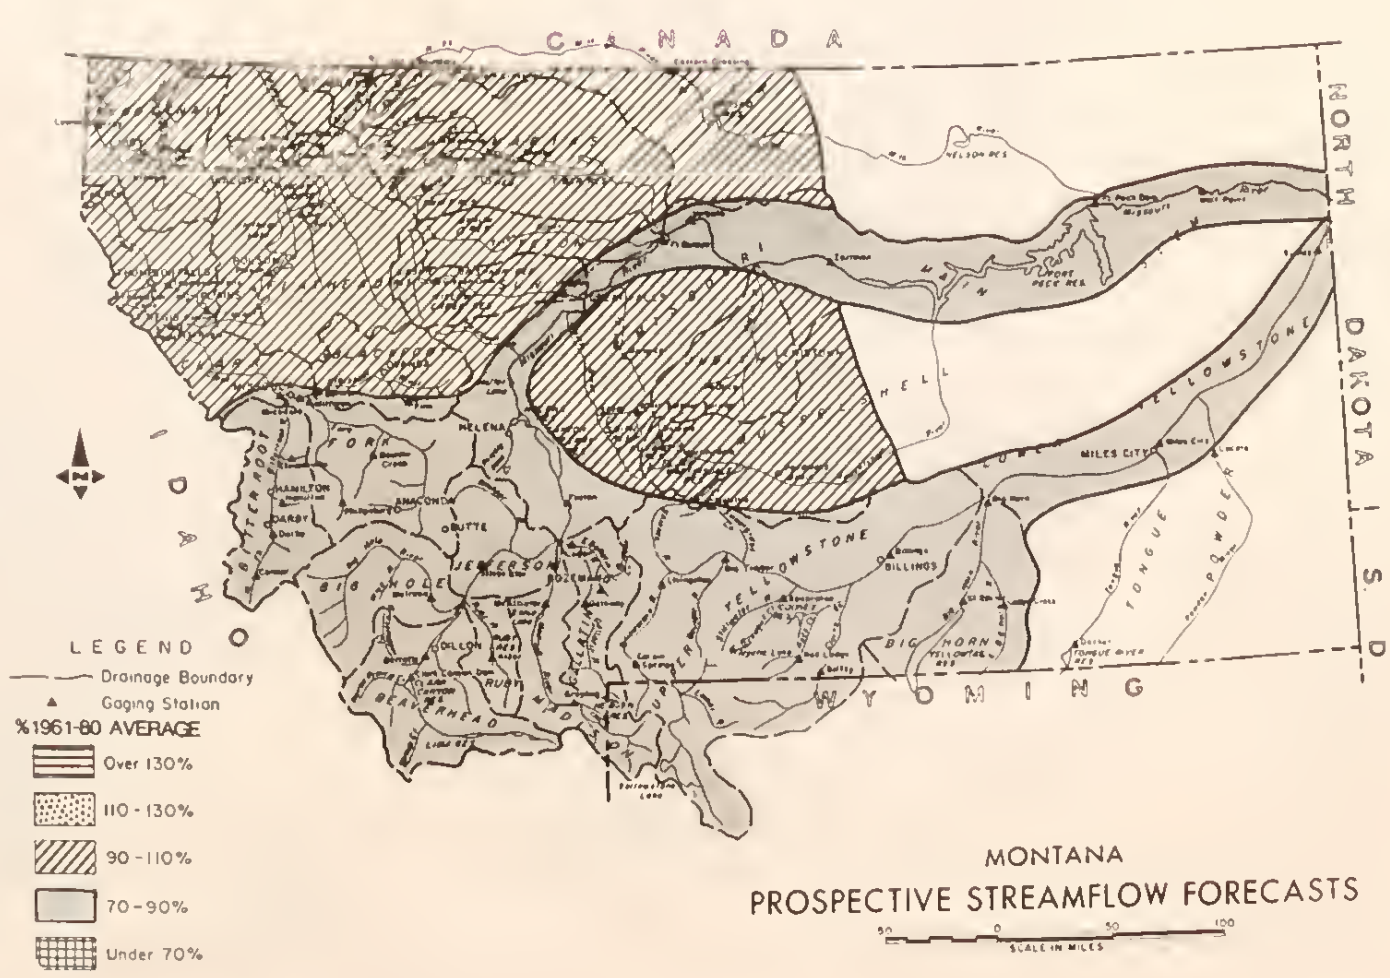
West of the Divide, all drainages above Missoula are expected to have below average runoff. The streams flowing into the Clark Fork downstream from Missoula and all of those in the Flathead and Kootenai River drainages should have near to a little below average streamflows.

East of the Divide, streams in the Missouri River headwaters and the main stem of the Missouri are forecast to have below average runoff this spring and summer.

Streamflows on tributaries north of the Missouri River and those in central Montana are predicted to be near to a little below average.

Runoff in the St. Mary's River basin should also be near average.

Below average runoff can be expected for all streams in the Yellowstone River drainage.



Missouri River & Hudson Bay Drainages

(13) Adjusted for storage in Lake Sherburne.

ALL FORECASTS PREPARED IN COOPERATION WITH THE NATIONAL WEATHER SERVICE

NOTE:
According to the Bureau of Reclamation; although forecasts at this time appear to be near normal - the outlook for water supply is critical because of unusual low storage in Fresno, Nelson and Sherburne.

Missouri streamflow forecasts vary

April through September runoff is forecast 10 to 20 percent below average on all headwater streams above Canyon Ferry Reservoir. Streams flowing into the Missouri River downstream are predicted to have spring and summer runoff that is only 5 to 10 percent below average. Runoff in the St. Mary's and Milk River drainages is expected to be near average.

Irrigation water supplies could be a little short in the southwest corner but near average in most other areas.

Most reservoirs that were drawn down last year in the northern areas are expected to refill this spring.

MISSOURI RIVER & HUDSON BAY DRAINAGES
MONTANA
MOUNTAIN SNOW WATER EQUIVALENT

February snowfall approaches average

Snowfall was about average during February in the headwaters of drainages downstream from Canyon Ferry Reservoir and near to below average in most Missouri River headwater streams.

Presently, the season's snow accumulation is below average over most drainages in the Missouri River headwaters. Exceptions are a small area in the Big Hole and Boulder River drainages near Butte where near average snowpack exists. The Bridger Mountain Range, northeast of Bozeman, has well below average snowpack. Downstream from Canyon Ferry, most drainages have near average snowpack except for the Musselshell River headwaters which is below average. The Bear Paw Mountains, south of Havre, have well above average snowpack levels.

Snowfall activity seemed to increase near the end of February in southern parts of the state. Hopefully, this area will receive enough additional snowfall over the next couple of months to improve the present outlook. If not, most of the southern areas can look for deficient conditions this year.

YELLOWSTONE RIVER DRAINAGE
MONTANA
MOUNTAIN SNOW WATER EQUIVALENT

Low runoffs expected

Spring and summer streamflows are forecast to be 15 to 20 percent below average over most of the Yellowstone River drainage.

If weather patterns do not improve, some shortages of irrigation water supplies can be expected in mid- to late summer.

SUMMARY of SNOW MEASUREMENTS

(COMPARISON WITH PREVIOUS YEARS)

RIVER BASIN and/or SUB-WATERSHED	Number of Courses Averaged	THIS YEAR'S SNOW WATER AS PERCENT OF: Last Year	THIS YEAR'S SNOW WATER AS PERCENT OF: Average †
Upper Yellowstone ab Livingston	20	106	79
Shields	10	81	72

Yellowstone (Total)	88	100	77

Yellowstone snowpack remains below average

The mountain snowpack is generally below average throughout the Yellowstone drainage. Snowfall during February was near to a little below average across the headwaters but was not heavy enough to make up for last month's deficiencies.

Parts of the lower Rock Creek and lower Clark's Fork River drainages near Red Lodge still have well below average snow.

ALL FORECASTS PREPARED IN COOPERATION WITH THE NATIONAL WEATHER SERVICE

Columbia streamflows a little below average

Streams in the Clark Fork River headwaters above Missoula are forecast to have 10 to 15 percent less runoff than average.

Flathead and Kootenai River tributaries should have runoff near to a little below average.

If current weather patterns continue, some shortages of irrigation water supplies can be expected in the Bitterroot, Blackfoot and Upper Clark Fork River areas.

COLUMBIA RIVER DRAINAGE
MONTANA
MOUNTAIN SNOW WATER EQUIVALENT

February accumulation near average

Snow accumulation during February was near average in most of the Columbia drainage except for some of the more southern areas.

In general, the water of the snowpack is about average in all headwaters north of Missoula and a small tip of the Clark Fork near Butte. Most of the Bitterroot River drainage and the Clark Fork above Missoula have below average snowpack. A small area in the Flint Creek, Boulder Creek, Rock Creek headwaters has a much below average amount of snow water content.

Weather patterns seem to be changing toward a little more precipitation in the southern part of Montana. Hopefully, this condition will continue. If conditions do not improve over the next couple of months, the snowpack for the season will be below normal in most areas upstream from Missoula and some water shortages could develop.
